TEAM HANDOVER BRIEFING

Production Deployment Guide

Complete technical guide for deploying the platform and configuring the cloud database.

REPOSITORY	BRANCH	TECH STACK	DEPLOYMENT TARGET
amal-bouden/eniso-cyberguards	main (clean & pushed)	Next.js 16 + Prisma + Turso	Vercel + Turso Cloud DB

⚠️ **Context:** All application code, Prisma driver adapters, and seed scripts are tested, committed, and pushed to **GitHub (`main`)**. The local machine had database connectivity issues with the remote Turso instance. Follow the steps below to connect a fresh remote database and deploy on Vercel.

1 Clone & Pull Latest Code

Ensure you are working with the latest commits on the `main` branch:

```
# Clone repository (or pull latest)
git clone https://github.com/amal-bouden/eniso-cyberguards.git
cd eniso-cyberguards
git checkout main
git pull origin main
npm install
```

2 Setup Cloud Database (Turso / LibSQL)

In serverless environments like Vercel, local SQLite files are read-only and ephemeral. The platform is configured to use **Turso** (Serverless SQLite over HTTP/WebSocket via `@libsql/client`).

Option A: Fast Turso CLI (2 minutes):

```
# Install Turso CLI:
# Windows (PowerShell): irm https://get.tur.so/install.ps1 | iex
# macOS / Linux: curl -sSfL https://get.tur.so/install.sh | bash

# Login and create database:
turso auth login
turso db create eniso-ctf-prod

# Get the Database URL:
turso db show eniso-ctf-prod --url
# Output format: libsql://eniso-ctf-prod-[your-org].turso.io

# Generate permanent Auth Token:
turso db tokens create eniso-ctf-prod
# Copy the JWT string generated
```

*Option B: You can also use the web UI at **https://turso.tech** (sign in with GitHub > Create Database > Generate Token).*

3 Environment Variables Configuration

Create a local `.env` file (and set these inside the Vercel Project Settings):

```
# 1. Database Connection (Turso)
DATABASE_URL="libsql://eniso-ctf-prod-[your-org].turso.io"
TURSO_DATABASE_URL="libsql://eniso-ctf-prod-[your-org].turso.io"
TURSO_AUTH_TOKEN="eyJhbGciOi..."

# 2. Security & Auth Session Secret (64-character hex string)
JWT_SECRET="e1a4d98f7c32084c8a45291b70cfef839218d6a894a73e51d9bc4901f4a9b6c2"

# 3. Emergency Admin Master Setup Code
SETUP_CODE="CYBERGUARDS-ADMIN-SETUP-2026"
```

4 One-Click Database Seeding

A standalone seed script (`scripts/seed-production.cjs`) is included. It connects directly via the LibSQL client, creates all tables, and provisions the admin and challenge catalog:

```
# Run standalone seed script (requires TURSO_DATABASE_URL & TURSO_AUTH_TOKEN in .env)
node scripts/seed-production.cjs
```

What is automatically created:

- All SQL Tables: `User` , `Challenge` , `Solve` , `InviteCode` .
- All **9 CTF Challenges** with flags, points, hints, categories, and instance URLs.
- Default Admin Account: `FLUTTERSHY` (`boudenammal02@gmail.com`).
- Active Invite Codes: `SPARTAN-2026-CTF` (100 uses) and `ENISO-JOIN-2026` (50 uses).

5 Deploying to Vercel

Follow these steps to deploy on Vercel:

- ☐ Log in to https://vercel.com and click **Add New Project**.
- ☐ Import Git repository: **amal-bouden/eniso-cyberguards**.
- ☐ Framework Preset: **Next.js** (automatically detected).
- ☐ Build Command: Leave default or ensure it runs `prisma generate; next build` (already configured in `package.json`).
- ☐ **Add Environment Variables** under Project Settings > Environment Variables:

VARIABLE NAME	DESCRIPTION	EXAMPLE / VALUE	REQUIRED
`DATABASE_URL`	Turso DB URL	`libsql://eniso-ctf-prod-*.turso.io`	Yes
`TURSO_DATABASE_URL`	LibSQL URL	Same as DATABASE_URL	Yes
`TURSO_AUTH_TOKEN`	Turso JWT Token	`eyJhbGciOi...`	Yes
`JWT_SECRET`	Auth Session Secret	64-char random hex string	Yes
`SETUP_CODE`	Emergency Admin Setup	`CYBERGUARDS-ADMIN-SETUP-2026`	Yes

```
# Or deploy via Vercel CLI from repository root:
npm install -g vercel
vercel --prod
```

6 Pre-Seeded Credentials & Access

Use these credentials to log in and administer the competition:

ACCOUNT TYPE	USERNAME	EMAIL	DEFAULT PASSWORD
Main Administrator	`FLUTTERSHY`	boudenammal02@gmail.com	`SpartanAdmin2026!`

Active Participant Invite Codes

INVITE CODE	MAX USES	AUDIENCE	PURPOSE
`SPARTAN-2026-CTF`	100 uses	ENISO Students / CTF Participants	Main CTF registration code
`ENISO-JOIN-2026`	50 uses	Workshop Attendees / Guests	Secondary / Workshop code

7 Troubleshooting & Tips

💡 **Prisma on Vercel Linux:** Commit `6812aad` already configured `binaryTargets = ["native", "rhel-openssl-1.0.x", "rhel-openssl-3.0.x", "linux-musl"]` in `prisma/schema.prisma` , preventing binary mismatch errors during Vercel builds.

💡 **Auto-Initialization:** The platform features an automatic self-initializing hook in `lib/db-auto-init.ts` . If the database is connected but empty, the application will automatically create the tables and seed the challenges on the first page request.
